Gulf Coast Family Dental

February 4, 2026

Table of Contents

Table of Contents 2

A Defined Cybersecurity Program 3

Secure Network Design and Implementation 3

Identity and Access Control (Who Can Access What) 3

Staff Security Training (With Proof It Worked) 4

Incident Response Plan (What Happens When Something Goes Wrong) 4

Penetration Testing (Testing Your Defenses Safely) 5

Logging, Monitoring, and Evidence Collection 5

Data Protection and Backup Strategy 6

Secure Business Infrastructure 6

Documentation You Keep 6

A Defined Cybersecurity Program

- *What you get*
  - A documented cybersecurity program based on the NIST Cybersecurity Framework
  - Clear explanation of what risks exist, what we are protecting, and how decisions are made
- *What it looks like*
  - A written program document in plain language
  - Clearly defined responsibilities for staff and our team
- *Why you care*
  - This gives you structure and accountability
  - If something happens, you can show you acted responsibly
  - This becomes the blueprint for everything else we build
- *When*
  - Delivered early in the engagement (Weeks 1-3)

Secure Network Design and Implementation

- *What you get*
  - A segmented network separating clinical systems, billing, and administrative access
  - A firewall configured to limit unnecessary exposure
  - Secure remote access for IT support only
- *What it looks like*
  - A clear network diagram you can understand
  - A working network where systems are separated instead of "everything talking to everything"
- *Why you care*
  - If one system is compromised, it doesn't take down the whole office
  - Reduces ransomware and unauthorized risk
  - Improves stability and predictability
- *When*
  - Designed mid-engagement, implemented shortly after

Identity and Access Control (Who Can Access What)

- *What you get*

    - Role-based access for dentists, hygienists, billing, and management
    - Least-privilege access so staff only see what they need
    - Removal of unnecessary shared or over-powered accounts
- *What it looks like*
    - Staff log in with accounts tied to their role
    - Billing access is protected more tightly than general clinical access
- *Why you care*
    - Prevents internal mistakes from becoming major incidents
    - Limits damage if an account is compromised
    - Makes audits and reviews much easier
- *When*
    - Implemented alongside the infrastructure build

Staff Security Training (With Proof It Worked)

- *What you get*
    - Security awareness training tailored to a dental office
    - Training focused on phishing, email safety, and daily behavior
    - Measurement of whether the training worked
- *What it looks like*
    - Short, role-appropriate training materials
    - Simple metrics showing improvement
- *Why you care*
    - Most breaches start with email
    - This directly reduces risk without slowing staff down
    - Shows due diligence on your part as the owner
- *When*
    - Delivered mid-engagement, reinforced later

Incident Response Plan (What Happens When Something Goes Wrong)

- *What you get*
    - A written Incident Response Plan
    - Clear steps for what to do if there's a breach, ransomware, or system outage
    - Defined roles: who calls whom and when

- *What it looks like*
    - A concise document you can reference under stress
    - No guessing during an incident
- *Why you care*
    - Reduces downtime
    - Prevents panic and bad decisions
    - Helps protect patient trust and your reputation
- *When*
    - Delivered before penetration testing

Penetration Testing (Testing Your Defenses Safely)

- *What you get*
    - A controlled, non-destructive penetration test
    - Testing performed as an external attacker would see your systems
    - A written report of what was tested and what was found
- *What it looks like*
    - A report explaining risks in plain language
    - No “Hollywood hacking” - safe and ethical testing only
- *Why you care*
    - Confirms whether the protections work
    - Identifies weaknesses before criminals do (vulnerability scan)
    - Gives you evidence of due diligence
- *When*
    - Late in the engagement, after controls are in place

Logging, Monitoring, and Evidence Collection

- *What you get*
    - Centralized logging of key systems
    - Basic monitoring for suspicious activity
    - Retention decisions based on cost and value
- *What it looks like*
    - Dashboards and alerts used by our team
    - Evidence available if an incident occurs
- *Why you care*
    - Let's issues be detected earlier
    - Supports investigations and insurance claims

    - Improves response effectiveness
- *When*
    - Implemented before pen testing

Data Protection and Backup Strategy

- *What you get*
    - Documented data backup policy
    - Tested recovery procedures
    - Protection for patient and billing data
- *What it looks like*
    - Backups that restore
    - Clear recovery expectations
- *Why you care*
    - Ransomware becomes an inconvenience instead of a disaster
    - Protects patient records and business continuity
- *When*
    - Implemented during infrastructure build

Secure Business Infrastructure

- *What you get*
    - Secure email and domain configuration
    - A basic professional website
    - A properly configured patient database backend
- *What is looks like*
    - Stable, predictable systems
    - Reduced exposure to common misconfigurations
- *Why you care*
    - Email in a major attack vector
    - Professional presence and technical hygiene reduce risk
- *When*
    - Build progressively throughout the engagement

Documentation You Keep

- *What you get*
    - All policies, diagrams, reports, and plans

    - Documentation suitable for future IT teams or audits
- *Why you care*
    - You're not locked into one vendor
    - You own the work product
